

Corne (crkbd/rev1) – Kiron's Layout

3x6+3 split keyboard · 6 layers · bottom row mods

Hold a bottom row key for the modifier, tap for the letter.

M0(n) = hold to activate layer n · DF(n) = switch default layer to n

Layer 0 – Base (Cyan)

			DF(0)	DF(0)	DF(0)

Activate: DF(5) from Layer 3

					▽
Plain	Breath	Rainbw	Knight	Grad	Twinkl

All three left thumbs return to base layer

Legend

▽ = transparent (falls through to layer below)
 ∅ = no-op (dead key, nothing happens)
 ▒ = layer is active from this key (held)
 Brt = brightness (value) Sat = saturation Spd = speed
 BOOT = enter bootloader for flashing
 Tog = toggle RGB on/off

Bottom row mod-taps (Layer 0): hold for modifier, tap for letter.
 On transparent layers, bottom row mods fall through from Layer 0.

RGB settings (brightness, saturation, effects) persist across all layers.
 Only the hue changes per layer.

36-key migration (in progress)

Goal: drop the outer pinky column on each side (3x6+3 → 3x5+3).
 Outer-column base keys are already re-homed so nothing is stranded:
 Tab, Esc → Layer 1 · \ → Layer 2 · ' / " → Layer 1
 Left/Right Shift → bottom-row mod-taps on Z and /
 Layers 1–4 are now clear of the outer columns.
 Still to relocate before switching to LAYOUT_split_3x5_3:
 Layer 5 – RGB Toggle (outer-left home) and Twinkle effect (outer-right home).
 Base layer outer columns (rebuilt when the macro changes).
